

Exporting and Importing Archived Eclipse Java Project

Exporting:

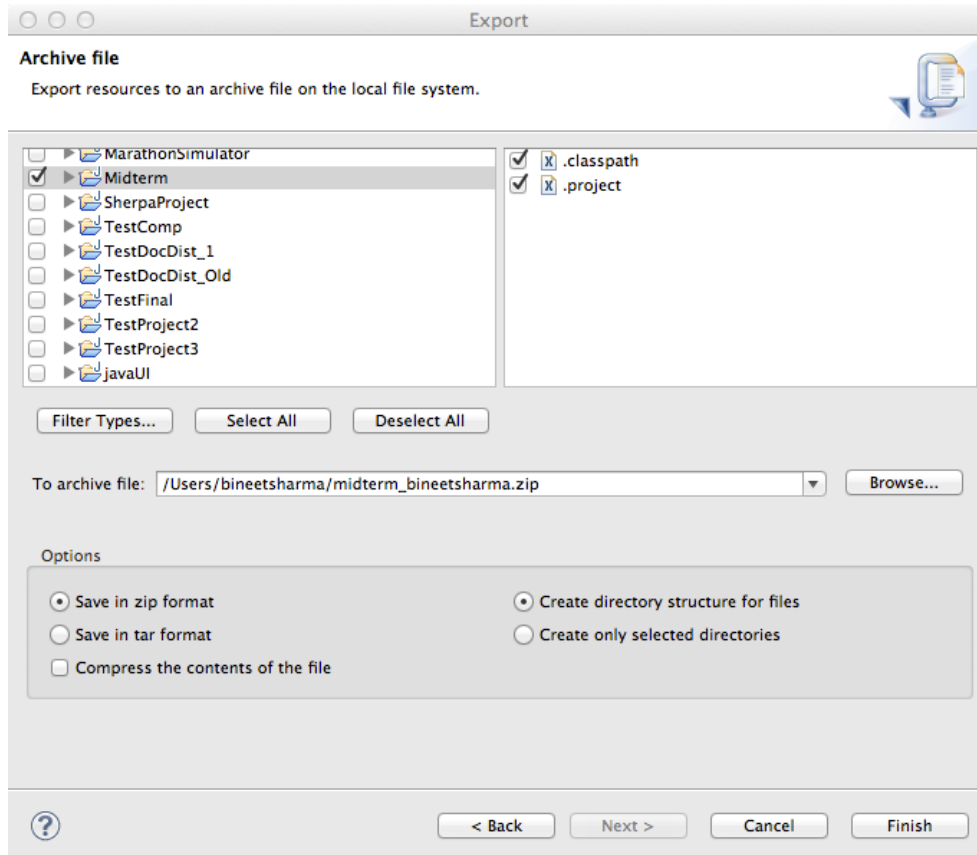

- 1) First make sure to create a backup of your project and save it in a safe place
- 2) Right click on project and elect Export

- 3) Select Archive File in General section

4) Make sure only the project you want to archive is selected. Select 'save in zip format' and 'create directory structures in file' options – if not already. Give it a name and note down the directory path it is saving – or browse to save somewhere else. Click finish. You are done

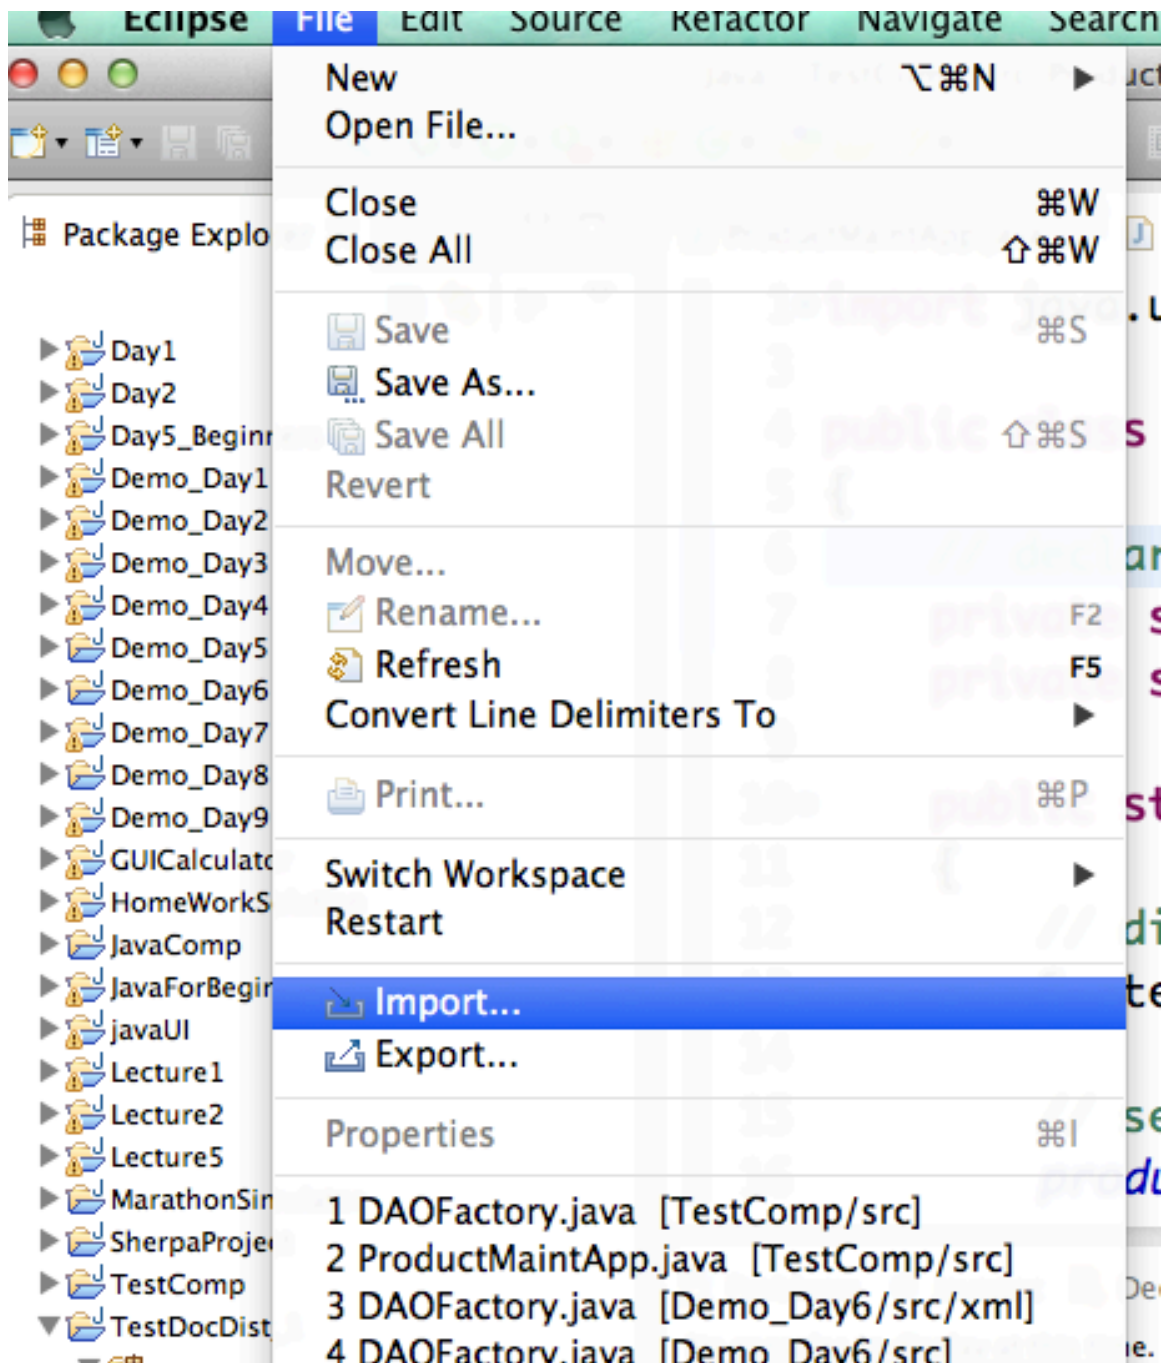

5) Verify that your export by importing yourself

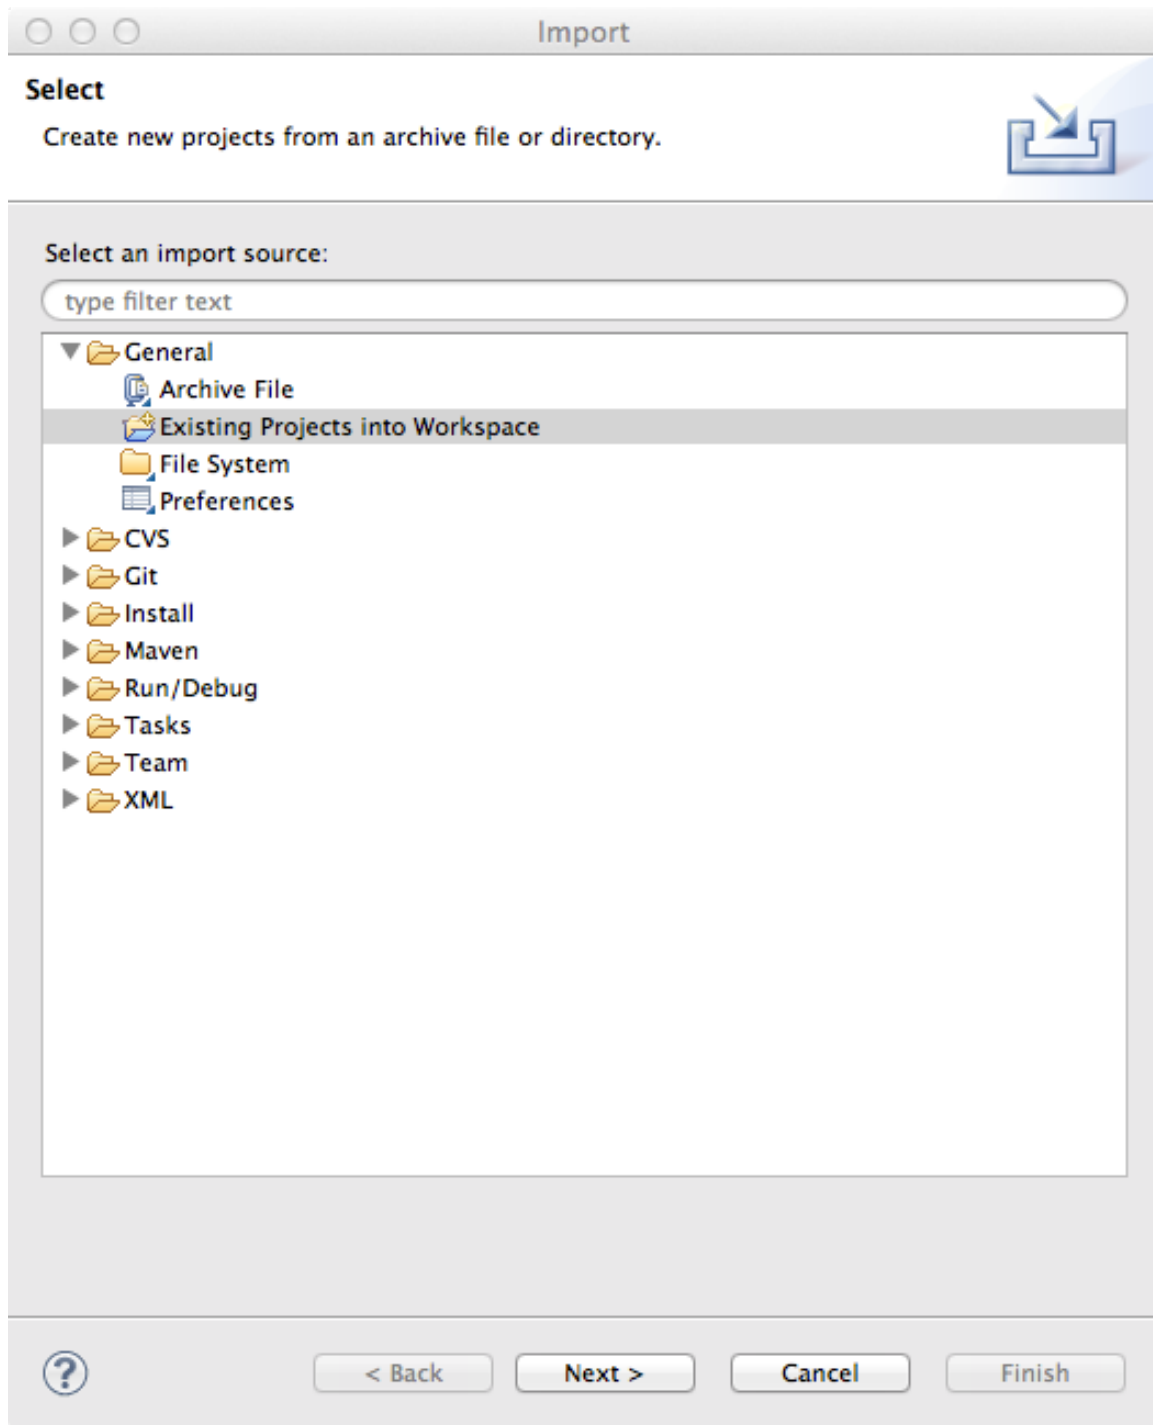

Importing a previously exported archive file:

Note: You can't import a project with same name, if you already have one with same name in your Eclipse, so you could simply rename your current project in the Eclipse to something else for now – if it already exists. (You may not know beforehand, but once you start the importing project Eclipse will tell you if the project already exists)

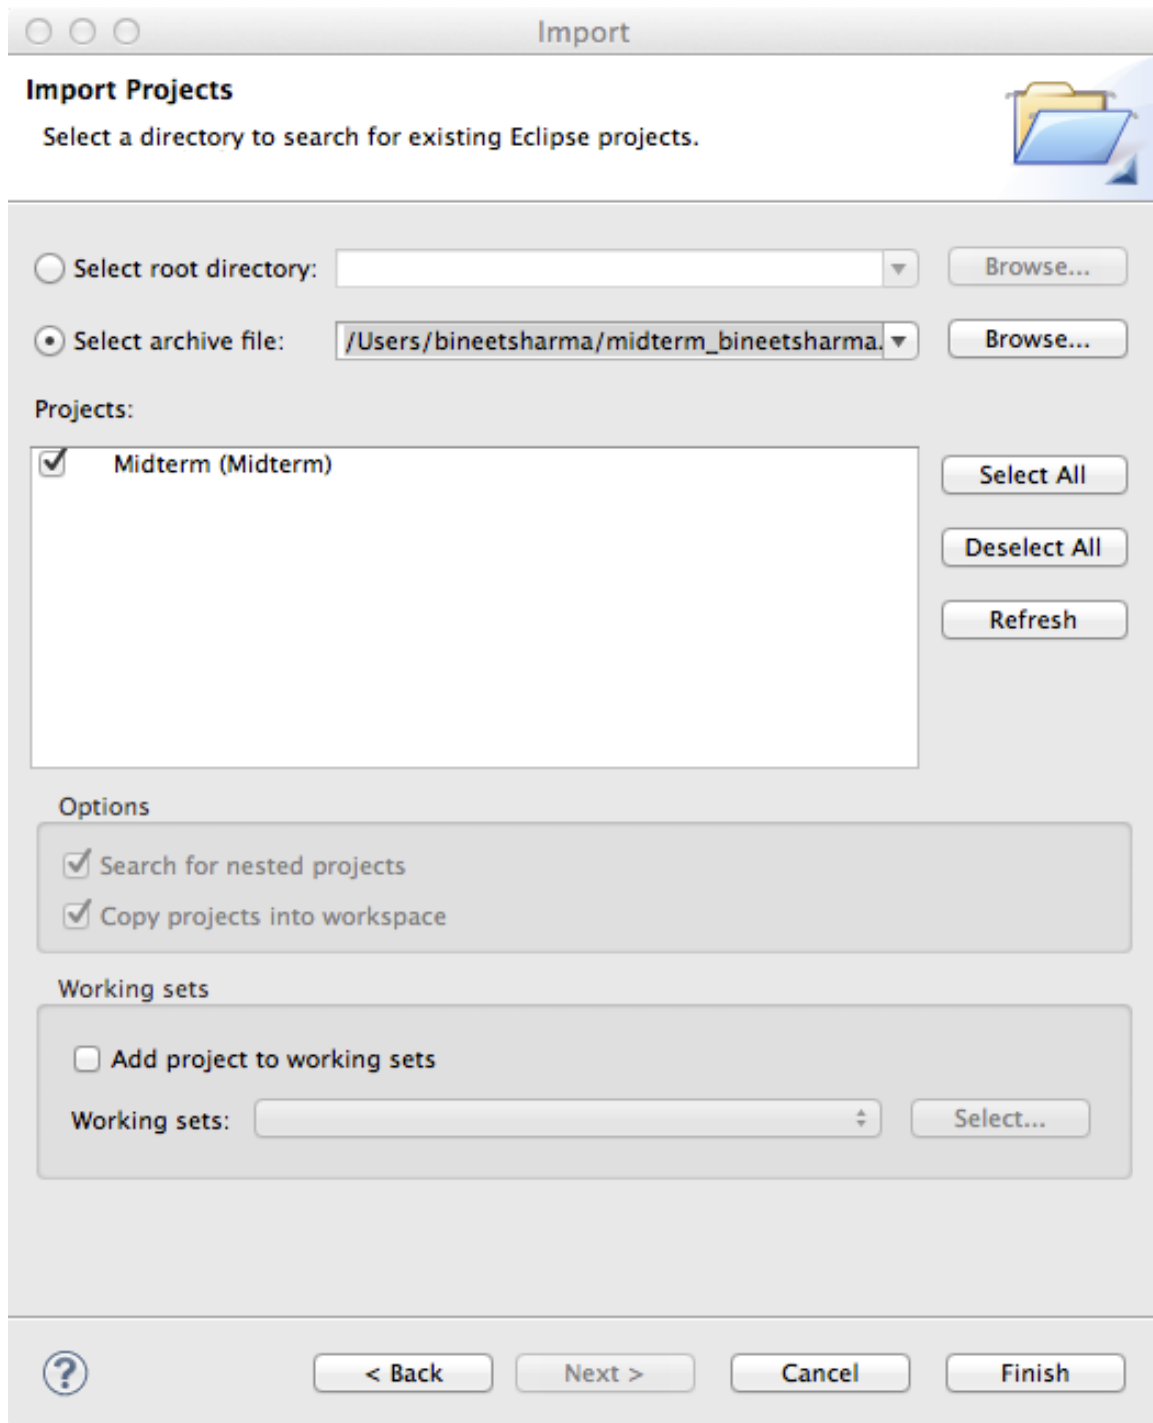

1) Click on file -> import

2) Select 'Existing Projects into Workspace' from General node

- 4) Browse your directory to select the previously exported archive file
- 5) Click on the project you want to import
- 6) Click finish

4) Check if the project was imported successfully by running your application
